COMET Cloud: Audit Trail

code: audit_trail

Full control over every change – a step towards CFR compliance

Audit Trail brings complete monitoring of all user and system actions to COMET Cloud. Every login, device configuration change, user rights modification, or alarm setting is automatically recorded and included in an audit report. This feature ensures full traceability and transparency of system operation – key requirements for validation in a regulated environment.

The Audit Trail feature brings a higher level of security, transparency, and data credibility to COMET Cloud. Thanks to automatic tracking of all changes and regular email reports, users have a constant overview of activities in the system. Audit Trail ensures data integrity and traceability in accordance with the requirements of 21 CFR Part 11 and the principles of good manufacturing practice (GMP).

For annual activation of Audit Trail in COMET Cloud**,** 1 additional credit is required on top of the device subscription (+1 credit).

Activating the Audit Trail feature reduces the remaining subscription for the device by half. This change is irreversible – the validity cannot be restored after disabling the feature and will expire without compensation
